AMIETE (IT)
DETAILED SYLLABUS

Introduction

Most of the Student Members of the IETE are working engineers/ technicians/science graduates or under graduates. Thus, due to occupational reasons and other factors these students are deprived of a formal education and therefore have to learn the subjects through self-study only.

Review of Syllabus

2. IETE periodically reviews the syllabi of AMIETE and the aim of these reviews is not only to renovate and modernize the contents but also to make them contemporary. The syllabi for both Electronics & Telecommunications (ET), Computer Science & Engineering (CS) and Information Technology (IT) streams have been reviewed recently.

3. Keeping the above aspects in view and based on feed backs/suggestions received from the students, this syllabus has been formulated to meet the following criteria:-

- The Syllabus should cater to the technological advancements.
- The textbooks should be available and affordable to the students.
- In the absence of a formal coaching to the students, there should be a reasonable correlation between the topics in a subject and the textbooks.

Salient Features

4. Some salient features of the syllabus are:-

- Each subject has a code preceding it (viz AE51, AC51 and AT51 are codes for Mathematics-I in ET, CS and IT streams respectively).
- In order to guide the student and to enable him/her to prepare well for an examination, each subject is divided into 8 units and each unit has the course contents to be covered in 7 or 8 hours.
- The textbooks have been numbered in Roman Numerical (viz I, II, III)
- The chapters and sections are mentioned inside the bracket e.g. I (2.1) would indicate chapter 2 and section 1 of textbook-I.

Scheme of the Examination

5. For all theory subjects the Question Paper contains

- 10 objective questions for 20 marks covering the complete syllabus
- 8 questions are from each unit and each question carries 16 marks.

6. Regular feed back from the students, academicians, corporate members and professionals is requested to keep this syllabus updated, so that our students keep abreast of latest technological changes. Though every effort has been made to identify standard and best textbooks for each subject, we welcome suggestions on availability of better and cheaper textbooks.

DBMS LAB

List of Experiments

1. Draw an ER diagram to capture the requirements as stated below:

A database is needed to capture information pertaining to the running of various clubs by the recreation cell of an institution.

- Details such as name, date of birth, gender are needed for each member.
- Club details are needed such as the activity type (oratorical, music, dance, instrumental music etc) and contact phone number.
- Team details required to include team name and the days on which the team practices.
- Tutor details such as tutor name, address and telephone number are also needed, along with details of the skill each tutor is qualified in.
- Rules governing the involvement of members and tutors in the teams and clubs are as follows:
 - o Members may head only one team and every team has to have a head. Tutors teach at least one team and every team has at least one tutor.
 - o Every member must belong to at least one team and each team has a number of members.
 - o Every team must belong to a club and clubs must have at least one team.
 - o Every club has a member who is the president but a member may only be president of one club.

Draw the ER Diagram for the above requirement. Map the ER diagram to the Relational Model.

Create tables identified and insert five tuples in each of the tables created. The students are required to carefully take care of the constraints on each of the table.

2. Consider the following three tables – SAILORS, RESERVES and BOATS having the following attributes

SAILORS (Sailid, Salname, Rating, Age)
RESERVES (Salid, Boatid, Day)
BOATS (Boatid, Boat-name, Color)

Use the above schema and solve the queries using SQL

- Find the name of sailors who reserved green boat.
- Find the colors of boats reserved by "Ramesh"
- Find the names of sailors who have reserved a red or green boat.
- Find the Sailid's of sailors with age over 20 who have not registered a red boat.

DESTINATION, SHIP_DATE)

Foreign Key: CUST_ID REFERENCES CUSTOMER, on deletion cascade

Foreign Key: TRUCK_# REFERENCES TRUCK, on deletion set to null

Foreign Key: DESTINATION REFERENCES CITY, on deletion set to null

WEIGHT must be under 1000 and defaults to 10

TRUCK (TRUCK_#, DRIVER_NAME)

CITY (CITY_NAME, POPULATION)

Perform the following queries:

- a) What are the names of customers who have sent packages (shipments) to Sioux City?

 - For each employee, retrieve the employee's name, and the name of his or her immediate supervisor.
 - Make a list of all project numbers for projects that involve an employee whose last name is 'Smith' as a worker or as a manager of the department that controls the project.
 - Retrieve the name of each employee who has a dependent with the same first name as the employee. {using Exists and Nested query}
 - Retrieve a list of employees and the projects each works in, ordered by the employee's department, and within each department ordered alphabetically by employee last name.

JAVA & WEB PROGRAMMING LAB

List of Experiments

1. Write a Java program to find the area & volume of a room. Use a class named *Room* with the following members.

Data members

- length
- breadth
- height

Methods

- to assign initial values
- to find the area
- to find the volume

2. Write a class that has three overloaded methods for calculating the area of the following geometric shapes

- Circles: area $= \pi r^2$
- Rectangles: area $= \text{width} * \text{length}$
- Cylinders: area $= \pi r^2 h$

Demonstrate the class in a complete Java program

3. Write a Java program to find the area and volume of a room. Use a base class rectangle with a constructor and a method for finding the area. Use its subclass room with a constructor that gets the value of length and breadth from the base class and has a method to find the volume. Create an object of the class room and obtain the area and volume.
4. Write a Java program to read data from keyboard up to N names, sort in alphabetical order using Bubble sort.
5. Write a Java program to count the number of tokens, given a string and a separator.
6. Write a Java program to find the average of n numbers. Use the input through the keyboard during runtime. The program must read the value of n first. If the input happens to be zero or negative a suitable user defined exceptions should be thrown. If it is not possible to convert the input into an integer, then NumberFormatException must be thrown. Use suitable try-catch blocks. After reading n value successfully, we must read the integer values of the array a[]. Each input string must be converted into integer. So use NumberFormatException appropriately.
7. Write a Java program to perform a file copy operation using the file streams of Java.
8. Write a Java program to find the number of characters, words, lines in a given input file.
9. Write a Java program to create an applet that uses flow layout manager to arrange the user interface components.
10. Write a Java program to create an applet named JSum that allows the user to enter two integers into two separate JTextFields. When the user clicks a JButton, the sum of the integers is displayed in a third JTextField.
11. Create a basic web page in the following set pattern:

Your page should have the following elements:

- Your name as a level one header

- "About me" as a level two header
- A short paragraph describing something interesting about yourself
- A level two heading saying something like "My Favorite things on the Internet"
- A paragraph describing the things you like to do on the Internet

12. Create a copy of the last page you made. Modify this new copy with basic CSS designations. Use Cascading Style Sheets technology to improve the colors and layout of your page.

You will be defining the style that explains how the text should be displayed.

- Add a CSS section to the header area
- Add a style for heading levels one and two, paragraphs, and the body
- If you have other HTML elements in your page, you can add CSS descriptors for them as well

Your CSS should contain at least one example of each of the following:

- color
- background-color
- text-align
- font-family

For question 11 and 12, your page must meet the following minimum criteria:

- It must validate to XHTML 1.0 Strict. Use the W3C validator to check your page as described in class.
- Try to write professionally. Use an online dictionary if necessary to check your spelling
- Use notepad or another basic text editor to create your page. Pages written in a GUI browser (like FrontPage or DreamWeaver) will not be accepted.

13. Write a CGI program that collects the name and email address of a person from an XHTML form and responds with a "Hello" message.
14. Create a JavaScript – enriched XHTML form with the following fields: First name, Last name, email, phone and check whether the user has filled in text fields before the form is submitted and prints out the values the user filled in. Make sure that, for fields the entry conforms to the following rules:
- Telephone number should include area code
 - Email should include two strings separated by "@"

Note:

- Minimum of 13 experiments to be conducted.
- To develop and run Java programs, use the NetBeans/Eclipse IDE (latest version).
